Technical Overview — Stack & Key Decisions

Generated 20 June 2026 · Carmen Foia — Clinical Psychologist, Oradea (RO)

At a glance

A bilingual (Romanian / English) marketing & booking website for a psychology practice. It is a **single-page React app** (no traditional server) backed by **Supabase**, with online booking and card payments handled by **Cal.com**. Content pages are **pre-rendered to static HTML at build time** so search engines and AI crawlers can read them, while the interactive pages stay as a fast client app. Hosted on **Vercel** with automatic deploys from GitHub.

Technology stack

Layer	Technology	Role
Frontend	React 18.3 + React Router 7.13, TypeScript	UI, routing, type safety
Build tool	Vite 6.3	Bundling, dev server, env handling
Styling	Tailwind CSS v4.1	Utility-first design system
Animation	Motion (Framer Motion) 12.23	Scroll & entrance animations
Backend / data	Supabase (Postgres, Auth, Storage) 2.108	Blog, news, testimonials, FAQ, promo codes; Row-Level Security
Booking	Cal.com Cloud (@calcom/embed-react)	Scheduling, calendar sync, reminders
Payments	Stripe (via Cal.com)	Card payments for paid sessions
CMS editor	TipTap 3.26	Rich-text editor in the admin panel
UI components	Radix UI + class-variance-authority	Accessible primitives (shadcn/ui-style)
Serverless	Supabase Edge Functions (Deno)	Hosts the DeepL translation function
Translations	DeepL API	One-click RO ↔ EN auto-translation in the CMS
Prerendering	Puppeteer 25 + @sparticuz/chromium 149	Build-time static HTML for content pages
Images	sharp 0.35	WebP compression & responsive sizes
Icons	lucide-react	Icon set
Analytics	Google Analytics 4	Traffic insights (loads only after consent)
Hosting / CI	Vercel	Static + edge hosting, auto-deploy on git push
Domain / DNS	Romarg (registrar) · DNS on Vercel	Single canonical host (non-www)
Email	Hostinger mailbox, used via Gmail	contact@psihologcarmenfoia.ro
SEO tools	Google Search Console, Business Profile	Indexing, search & local visibility

Key technical decisions

■ Client-rendered SPA (not Next.js / SSR)

Vite + React keeps the stack lightweight with no server to run or maintain. The site is mostly an interactive booking and admin experience, which suits a client app; SEO is solved separately via prerendering.

■ Hybrid prerendering for SEO & AI search

At build time, a headless-Chrome step renders the content pages (blog articles, news, FAQ, legal) to static HTML with per-page meta and JSON-LD, so Google and AI crawlers (which don't run JavaScript) read full content. The homepage and the booking page intentionally stay as the lean app shell — the homepage for speed, and /contact because the Cal.com booking embed must initialise live.

■ Supabase as the only backend

Postgres + Auth + Storage with Row-Level Security replaces a custom server. It powers the bilingual CMS (blog, news, testimonials, FAQ) and the promo-code validation, all editable from a built-in /admin panel.

■ Cal.com for booking & payments

No custom scheduling or payment code. Separate Cal.com event types per location (online vs. in-person) enforce the correct meeting type and Google Meet link, with Stripe handling card payments.

■ Performance engineering

Route-level code-splitting, vendor chunking, deferring the database client off the critical path, a preloaded & responsive hero image, non-render-blocking fonts, and WebP compression — moving the mobile performance score out of the red.

■ SEO / AEO (answer-engine optimisation)

Structured data (Psychologist, Article, FAQPage, NewsArticle), sitemap.xml, robots.txt, an llms.txt summary for AI tools, per-page titles/descriptions, and a no-JavaScript content fallback on the homepage.

■ GDPR-first analytics

Google Analytics 4 loads only after the visitor accepts analytics cookies, with IP anonymisation — no tracking scripts run before consent.

■ Bilingual with geo default

Romanian / English throughout, defaulting by visitor location (Romania → Romanian, elsewhere → English), with a manual language switch.

■ Automated bilingual content (DeepL)

Blog, news and FAQ entries are written once and translated between Romanian and English with one click in the admin panel, via DeepL called through a Supabase Edge Function. The DeepL API key is stored as a server-side secret and never reaches the browser.

■ Accessible component layer

The UI is built on Radix UI primitives with class-variance-authority and tailwind-merge (shadcn/ui style), giving keyboard-navigable, accessible dialogs, tabs, tooltips and form controls out of the box.

■ Promo codes for free sessions

A Supabase table plus a security-definer function validates a code without exposing the list of valid codes; a valid code routes the booking to a free Cal.com event type.

■ Single canonical domain

psihologcarmenfoia.ro (non-www) is the one canonical host; www performs a 308 redirect, kept consistent across canonical tags, sitemap, social cards and the Stripe payment domain.

Repository & deployment

Source lives in a private GitHub repository. Every push to **main** triggers an automatic Vercel build and deploy. The build runs `vite build`, then the Puppeteer prerender step (which also generates the sitemap), producing static files served from Vercel's edge. Secrets (Supabase keys, the GA measurement ID) are stored as Vercel environment variables, not in the code.
